

KICKSTARTER Projects: Is This Project Going to Reach its Crowdfunding Goal?

Lior Solomon, Eva Marciano, Omer Sarig and Yotam Aharony

TAU

Who **Are We**?

Yotam Aharony
EE & CS, 4th year

Lior Solomon
EE & CS, 4th year

Omer Sarig
EE & CS, 4th year

Eva Marciano
CS, 3rd year

What is KICKSTARTER?

Kickstarter is an American public-benefit corporation, that maintains a [global crowdfunding platform](#) focused on creativity and merchandising.

How does it **Work**?

Project

Set up a Finite work you'd like bring to life

Funding Goal

Set up the amount of money need to complete the project

Backers Pledge

Join the creators in bringing the project to life

all-or-nothing

No charged for a pledged towards a project unless it reaches its funding GOAL

reward

A creator's change to share a piece of their project with their backers

Project Problem Formulation

Determine whether a new Kickstarter project is going to raise his crowdfunding goal by **Machine Learning Model** based on dataset of over 300k past projects

Our DataSet .

Over 300k projects (entries)

id internal kickstarter ID

name name of project | state current condition the project is

Category category | main_category category of the campaign

launched date launched | deadline deadline for crowdfunding

goal fundraising goal | pledged amount pledged by "crowd" | backers number of backers

country country pledged from

Initial Analysis

#status

KICK
STARTER
STAFF
PICK

Undefined, live and suspended are 1% from all entries
Failure is obviously the most common status

Initial Analysis

#country

N,0'' country – needs to be cleaned
Understand why US, GB, HK have higher success rate than IT, AT, JP (for example)

Initial Analysis

#category

There are categories which the probability that the project will succeed is higher
TODO: cross country and category

#goal

Initial Analysis

GOAL < 10K\$

10K\$ < GOAL < 100K\$

100K\$ < GOAL < 1M\$

GOAL > 1M\$

Greater Goal -> Lower success rate

KICKSTARTER

Initial Analysis

#duration

MONTH TO TWO MONTHS

* Two months is the maximum amount of time

Seems like there's no correlation between success and duration. TODO: try finding a correlation between time on the year (month, holiday, special event) and success rate

More *Analysis* to Come...

- How does the *name/description* influence the status?
 - Does *#words* matter?
 - Does *#syllables* (difficult words) matter?
 - Specific key words promise success? (such as “machine learning”)
- Does the *economy status* in the country influence?
 - Migrate with country/GDP dataset
- Does the *happiness state* in the country influence?
 - Migrate with World Happiness Report

Previous Work

Several previous works

- Most of them just clean the Dataset and try to predict whether the project is going to succeed
- ~60%-75% prediction accuracy
- One had interesting descriptive analysis but ~~NO PREDICTION~~
 - Analyse name/description, launch date period and more

We want **higher prediction accuracy**

We migrated **outside information** such as country's GDP

TODO: migrate further information such as cultural preferences, country's happiness report and more

More to come...
